ABSTRACT

This project gives the user of the HP-41 handheld programmable calculator a series of programs that give acceptable results during the preliminary phases of the helicopter design process. The project consists of three parts.

The first part consists of several short programs and their subroutine form. These programs and subroutines compute density altitude, density, disc area, solidity, tip velocity, induced velocity, coefficient of thrust, tip loss factor, equivalent chord, and ground effect.

The second part consists of major subroutines. These subroutines compute profile power, induced power, climb power, parasite power, and total power; equivalent area and induced power for a tandem rotor; and data input and change.

The third part consists of the main programs. These programs compute the various power requirements for hovering flight, forward (straight and level) flight, vertical flight, and forward climbing flight; also tailrotor power, autorotative flight, and tandem rotor flight.

I. INTRODUCTION

A. BACKGROUND

This project was undertaken to give the user of the HP-41 Programmable Calculator a series of programs that would give acceptable results during the preliminary phases of the helicopter design process. The HP-41 is a handheld programmable calculator designed and manufactured by the Hewlett-Packard Company of Corvallis, Oregon. This personal computing system easily fits into a coat pocket, thus being able to go anywhere. This, in turn, gives the preliminary design engineer a computational versatility and flexibility not previously experienced. To date, no known project of this magnitude has been attempted with a handheld calculator.

B. GOALS

The single goal of this project was to construct a series of self-prompting, alpha-numeric programs that could be used with acceptable results during the preliminary helicopter design process. In doing this, this project supplements the theory and computational processes as outlined by Professor Donald M. Layton in Aircraft Performance [Ref. 1]. An additional projected end use was for utilization by the Aeronautical Engineering students of the Naval Postgraduate School enrolled in the Helicopter Performance and Helicopter Design courses.

II. APPROACH TO THE PROBLEM

The basic line of approach used in this project was to construct calculator programs consisting mainly of subroutines. The subroutine is the key ingredient of this effort for the following reasons:

1. The use of subroutines greatly reduces the amount of required calculator program memory. Numerous main programs utilize the same basic equations and computational techniques even though the end results will be different. When these processes are organized into subroutine format, the numerous main programs can call and execute these common subroutines repeatedly, until the desired outputs are calculated for the particular flight conditions. For example, program "FORFLT" and program "VERFLT" are different in that program "FORFLT" will calculate the power requirements for forward (straight and level) flight while program "VERFLT" will calculate the power requirements for vertical flight. The results will be different, yet both main programs will call and execute fifteen identical subroutines where computational techniques are the same for both programs. The end result being that program memory, i.e. the number of calculator registers required, is optimized.

2. The use of subroutines greatly enhances the ease of program editing. Each individual subroutine calculates a

single specific function or variable, i.e. rotor disc area, rotor solidity, ground effect, density of the air, etc. Perhaps the user of these programs does not agree with the theory used for calculating ground effect or perhaps the user knows of a shorter technique that will greatly reduce the required amount of program memory for storage of the subroutine. The user need only edit that particular subroutine and no more. Confusion has been minimized, and there is no need for massive amounts of program editing.

These subroutines and this project utilize the basic aerodynamic theories of the helicopter, and it is not the intention of this project to teach this theory, nor is it the intention of this project to teach calculator programming operations. The user of these programs is assumed to have a basic knowledge of helicopter aerodynamics and it is further assumed that the user is proficient with the HP-41 programmable calculator.

III. THE SOLUTION

A. PROGRAM AND SUBROUTINE ORGANIZATION

The program and subroutine documentation used throughout this project exists in six sections. The nature of each of these sections is as follows:

1. Purpose

This section gives a brief description of the intended purpose of the program or subroutine. This section will often show a listing of the various program displays and outputs.

2. Equations

This section lists the various equations used within the program or subroutine. If the program or subroutine should call and execute another subroutine, this section will not list nor discuss the equations used by the "called" subroutine. This section will also list and describe the notation used in the equations listed. Whenever applicable, units are also listed as part of the notation description. The vast majority of the equations used in these programs come from Aircraft Performance [Ref. 1], NACA Report [1235] [Ref. 2], and Aerodynamics of V/STOL Flight [Ref. 3].

3. Flowchart

This section contains a flowchart which is an outline of the computational process utilized in the program or

subroutine. The standard HP-41 flowcharting symbols as outlined in the Hewlett-Packard Owner's Handbook and Programming Guide [Ref. 4] have been used:

circles for beginning and ending a program or subroutine

rectangles to represent the functional operations

diamonds to represent the decision processes.

The rectangle was modified somewhat from the standard HP notation in order to visually represent a subroutine:

modified rectangle to represent subroutine operation

4. Example Problems and User Instructions

This section represents a series of example problems that when executed by the user, will serve to familiarize the user with program operation, program displays, required calculator key strokes, program notation, program inputs, and program outputs. The example problems contain the design data of actual operational military helicopters which in turn serves to familiarize the user with these aircraft. A word of warning must be emphasized. The results or outputs

of these programs when compared with actual operational data are sometimes amazingly accurate, but at other times, they are not. Again, the theory used in computation uses numerous assumptions that do not take into account actual flight and operational conditions. Therefore, when executing power requirements, these programs should never be used in lieu of the appropriate manufacturer's performance charts or operator's manuals. Again, the purpose of these programs is to give the preliminary design engineer acceptable figures in the preliminary helicopter design process and not to supercede performance charts or operator's manuals.

5. Programs and Subroutines Used

This section lists all of the programs and subroutines used during the execution of the main program or subroutine. The user must insure that the listed programs and subroutines are in program memory before execution of the program is attempted otherwise the word "NONEXISTENT" will appear in the calculator display as the calculator searches for a subroutine or program that cannot be found in the calculator's program memory. As expected, the program cannot and obviously will not be executed.

6. Program Listings

This section contains a listing of the program lines of the program or subroutine. In some cases, as in Appendix B, both the program and its subroutine version are listed. The main programs listed in Appendix D will call and execute

many of the major subroutines listed in Appendix C as well as the minor subroutines listed in Appendix B.

IV. RESULTS

The results of this programming project are presented in Appendices B, C, and D. Appendix B contains many short programs and their subroutine form. These programs execute simple calculations such as solidity of the rotor system, rotor disc area, density of the air, etc. Appendix C contains major subroutines. These subroutines execute major calculations such as induced power, profile power, data input, tandem rotor equivalent area, etc. Appendix D contains the major programs for power required calculations. These main programs call and execute many of the minor subroutines found in Appendix B and many of the major subroutines found in Appendix C.

The validity of the output of these programs is excellent for the intended purpose of preliminary helicopter design calculations and estimations. As mentioned previously, the idealized theory used does make several assumptions and thus certain limitations are imposed upon the results. Some of the limitations are listed here:

1. Symmetric airfoils with zero twist are used throughout these programs. All actual helicopters have main rotor blades which utilize some degree of twist. This in turn will affect the overall lift generation and distribution.

2. The streamlining effects of the vertical fin on tail rotor power requirements in forward flight were not modeled and thus taken into account.

3. Compressibility effects on the advancing main rotor blade and stall effects on the retreating main rotor blade were not modeled and thus taken into account. Both of these effects will add to the overall horsepower requirements in forward flight computations.

4. The theory used did not take into account accessory losses such as hydraulic pumps, electrical generators, fuel pumps, heaters and air conditioners. Nor did the theory take into account drive train losses such as gear and transmission friction. All helicopter manufacturers will in some form incorporate these losses into their performance charts.

5. These programs do not take into account the main rotor downwash effects on the helicopter fuselage. This is a small horsepower requirement and was neglected here.

6. These programs do not take into account those real world operating conditions that have an overall effect on the performance of the helicopter. These conditions include, but are not limited to, engine erosion, dirty engine compressor blades, dirty and/or dented rotor blades. Again, these programs should not be substituted for performance charts and operator's manuals.

V. CONCLUSIONS AND RECOMMENDATIONS

The user of these programs should work through the example problems given in the various program and subroutine listings. In doing so, Table I, Appendix A, An Alphabetical Listing of All Calculator Displays and Their Intended Meaning, will become a valuable aid. Table II, Appendix A, Program and Subroutine Storage Requirements, will also become useful in that it readily assists the user in keeping track of the calculator memory required and remaining. And, if it becomes necessary, Table III, Appendix A, Storage Register Utilization, will assist the user in the program editing process in that it lists the program registers used and their contents; 32 program registers have been used. The user should insure that the calculator has been sized for Ø31 before attempting execution of the programs.

APPENDIX A

QUICK REFERENCE TABLES

The tables in this appendix will serve the user of this project as a source of quick reference. Table I is an alphabetical listing of all the possible calculator displays and their intended meanings. Table II lists all of the programs and subroutines and their respective storage requirements both in terms of registers required and bytes required. This table readily assists the user in keeping track of the calculator memory required and remaining. Table III lists the storage registers and their utilization. This table will assist the user in the program editing process.

TABLE I

AN ALPHABETICAL LISTING OF ALL CALCULATOR
DISPLAYS AND THEIR INTENDED MEANINGS

Display	Explanation	Formula Notation
AREA=	Answer: rotor disc area in ft^2	A_D
a=?	Prompt: fraction of the radius where the taper starts on a tapered rotor blade (decimal value)	a
B=	Answer: tip loss factor (decimal value)	B
b=?	Prompt: number of blades in the rotor system	b
BOTH	indicates calculator is about to execute combination of vertical flight and horizontal flight (forward climbing flight)	-
C=?	Prompt: chord length of the rotor blade in ft	C
CdO=?	Prompt: average profile drag coefficient	\bar{C}_{d_o}
CE=	Answer: equivalent chord in ft	C_e
CHANGE?	Prompt: asks if the original input data now needs to be changed. 1 is Yes, 0 is No	-
C RV b R W	chord-rotational velocity-number of blades-radius-weight, press key on calculator keyboard directly beneath the variable in need of change	C Ω b R W
CT=	Answer: coefficient of thrust	C_T
C0=?	Prompt: root chord in ft	C_0

TABLE I
(continued)

Cl=?	Prompt: tip chord in ft	C_1
d=?	Prompt: distance between the rotor shafts of a tandem rotor helicopter in ft	d
DA=	Answer: density altitude in ft	h_ρ
DA=?	Prompt: density altitude in ft	h_ρ
d(HOR.GLIDE)=	Answer: horizontal distance travelled on the ground at the forward autorotative flight velocity for minimum rate of descent in ft	d
D.L.=	Answer: disc loading of the rotor system in lbs/ft^2	D.L.
D.N.=	Answer: density of the air $\frac{\text{lb-sec}^2}{\text{ft}^4}$ or $\frac{\text{slug}}{\text{ft}^3}$	ρ
F=	Answer: a non-dimensional coefficient used in autorotation calculations	\bar{F}
FOR ONLY?	Prompt: execute forward flight portion of program only? 1 is Yes, 0 is No	-
FOR V=?	Prompt: forward flight velocity in kts	V_f
F.P.A.(FF)=?	Prompt: equivalent flat plate area for forward flight calculations in ft^2	f_f
F.P.A.(VF)=?	Prompt: equivalent flat plate area for vertical flight calculations in ft^2	f_v
GE=0	Answer: ground effect on the induced power is equal to zero	-

TABLE I
(continued)

GE=0,RATIO=1	Answer: ground effect on the induced power is equal to zero, therefore the ground effect ratio is equal to 1	-
H=?	Prompt: height of the rotor system above the ground in ft	h
HOVER?	Prompt: execute hovering flight portion of program only? 1 is Yes, 0 is No	-
LCM=?	Prompt: lift coefficient multiplier in drag coefficient terms	K_1
L(TAIL)=?	Prompt: tail length; distance from center of main rotor shaft to center of tailrotor shaft in ft	l_t
M(TIP)=	Answer: Mach Number at the tip of the advancing rotor blade	M_T
PA=?	Prompt: pressure altitude in ft	h_p
PC=	Answer: climb power in horsepower	P_c
PI=	Answer: induced power in horsepower	P_i
PI(TL)=	Answer: induced power with tip losses in horsepower	$P_{i(TL)}$
PI(TL+GE)=	Answer: induced power with tip losses plus ground effect in horsepower	$P_{i(TL+GE)}$
PO=	Answer: profile power in horsepower	P_o
PO(TDM)=	Answer: profile power for a tandem rotor helicopter in horsepower	P_o

TABLE I
(continued)

PP=	Answer: parasite power in horsepower	P_p
PT(ACFT)=	Answer: total power for the aircraft in horsepower	P_T
PT(MR)=	Answer: total power for the main rotor in horsepower	P_T
PT(TDM)=	Answer: total power for a tandem rotor helicopter in horsepower	P_T
PT(TR)=	Answer: total power for the tailrotor in horsepower	P_T
R=?	Prompt: radius of the rotor system in ft	R
RATIO=	Answer: ground effect ratio	-
REC=?	Prompt: is the rotor blade of rectangular planform? 1 is Yes, 0 is No	-
RV=?	Prompt: rotational velocity of the rotor system in radians/second	Ω
SOLID=	Answer: the solidity of the rotor system	σ_r
T=?	Prompt: ambient temperature in degrees celsius	T(°C)
TR DATA	the calculator is now ready to prompt for the tailrotor data input	-
U=	Answer: the advance ratio	μ
VERT ONLY?	Prompt: execute vertical flight portion of program only? 1 is Yes, 0 is No	-
VERT V=?	Prompt: vertical velocity in ft/min	V_v

TABLE I

TABLE III
STORAGE REGISTER UTILIZATION

Storage Register	Stored Quantity
00	blank - used for computations
01	C_0 - the root chord of the rotor blade (ft)
02	C_1 - the tip chord of the rotor blade (ft)
03	a - fraction of radius where the taper starts on a tapered rotor blade (decimal value)
04	C or C_e - the chord or equivalent chord length of the rotor blade (ft)
05	R - the radius of the rotor system (ft)
06	b - the number of blades in the rotor system
07	\bar{C}_{d0} - the average profile drag coefficient
08	Ω - the rotational velocity of the rotor system (radians/sec)
09	h - rotor system height above the ground (ft)
10	W - weight of the helicopter (lbs)
11	ρ - density of the air $\frac{\text{lb-sec}^2}{\text{ft}^4}$ or $\frac{\text{slug}}{\text{ft}^3}$
12	A_D - rotor disc area (ft ²)
13	V_T - velocity of the rotor tip (ft/sec)
14	C_T - coefficient of thrust
15	B - tip loss factor
16	$P_{i(TL)}$ - induced power with tip losses (horsepower)
17	h/D - height ÷ diameter of rotor system used for ground effect calculations

TABLE III
(continued)

18	$P_{i(TL+GE)}$ - induced power with tip losses plus ground effect (horsepower)
19	σ_r - the solidity of the rotor system
20	v_i - induced velocity (ft/sec)
21	P_o - profile power (horsepower)
22	blank - used for computations
23	V_v - vertical velocity (ft/sec)
24	f_v - equivalent flat plate area for vertical flight calculations (ft ²)
25	V_f - forward velocity (ft/sec)
26	f_f - equivalent flat plate area for forward flight calculations (ft ²)
27	v_{iT} - vertical component of the induced velocity through the rotor system for forward climbing flight (ft/sec)
28	P_p - parasite power (horsepower)
29	P_c - climb power (horsepower)
30	P_T - total power (horsepower)
31	indirect storage register - used by all the main programs in conjunction with Subroutine "CG"

note - Subroutine "CF", Subroutine "VC", and Program "TR" contain the only deviations from the above table in storage register utilization. This is done to optimize calculator storage requirements. The appropriate program or subroutine listing gives a complete explanation for the appropriate deviation. The calculator should be sized for 032.

APPENDIX B

MINOR PROGRAMS AND SUBROUTINES

This appendix consists of several short programs and their subroutine form. These programs compute density altitude, density, disc area, solidity, tip velocity, induced velocity, coefficient of thrust, tip loss factor, equivalent chord, and ground effect. The subroutines will be called and executed by the main programs in appendix D.

DENSITY ALTITUDE

1. PURPOSE

This program computes the density altitude, h_ρ , in feet when given the pressure altitude, h_p , in feet and the temperature in degrees celsius. The equation used for this program is based upon the standard atmosphere and described in NACA Report (1955) No. 1235 [Ref. 2]. This equation and thus this program is accurate to an altitude of 36,089 feet (isothermal level).

2. EQUATIONS

$$\frac{(1 - K_1 h_p)^{5.2561}}{(1 - K_1 h_\rho)^{5.2561}} = \frac{T}{T_{ssl}} \quad (1)$$

where:

T is the ambient temperature (absolute)

T_{ssl} is the standard sealevel temperature (absolute)

h_p is the pressure altitude (feet)

h_ρ is the density altitude (feet)

K_1 is a constant equal to 6.875×10^{-6}

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

The altimeter of a UH-60A currently indicates a pressure altitude of 1600 feet and the O.A.T. (Outside Air Temperature) gauge indicates 24° Celsius. What is the density altitude?

Keystrokes:

[XEQ] [ALPHA] DA [ALPHA]

1600 [R/S]

24 [R/S]

note - do not touch the calculator and proceed immediately to the next problem

Display:

PA=?

T=?

DA=3,006.48

The same UH-60A is now sitting on the deck of a ship. The altimeter indicates 0 feet and the O.A.T. gauge indicates 15°.

What is the density altitude?

Keystrokes:

[R/S] [R/S]

DENSITY

1. PURPOSE

This program/subroutine computes the density of the air at a given altitude. The equation used for this calculation is based upon the standard atmosphere and described in NACA Report No. 1235 [Ref. 2]. This equation and thus this program is accurate to an altitude of 36,089 feet (isothermal level). This program is therefore considered sufficient for all computations using density, ρ , here and in succeeding programs.

2. EQUATIONS

$$\rho = \rho_{ss1} \left[1 - (K_1)(h) \right]^{4.2561} \quad (2)$$

where:

ρ_{ss1} is the density of the air at standard sea level conditions which is equal to

$$0.0023769 \left[\frac{\text{lb} \cdot \text{sec}^2}{\text{ft}^4} \right] \quad \text{or} \quad \left[\frac{\text{slug}}{\text{ft}^3} \right]$$

K_1 is a constant equal to 6.875×10^{-6}

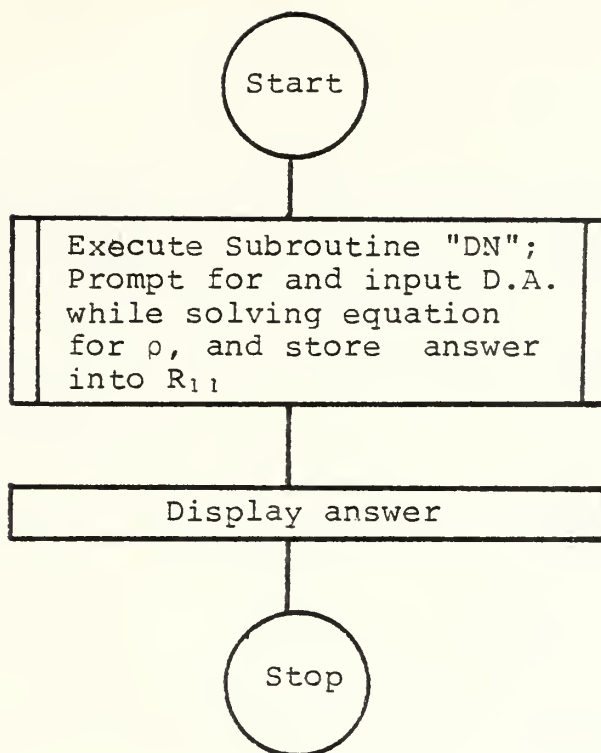

h is the density altitude (ft)

ρ is the density of the air at level h

with the input of known values, the equation to be programmed now becomes:

$$\rho = 0.0023769 \left[1 - (6.875 \times 10^{-6})(h) \right]^{4.2561} \quad (3)$$

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

DISC AREA

1. PURPOSE

This program/subroutine calculates the disc area of a rotor system when given the radius. The disc area is the total area enscribed by the plane of the rotor without coning.

2. EQUATIONS

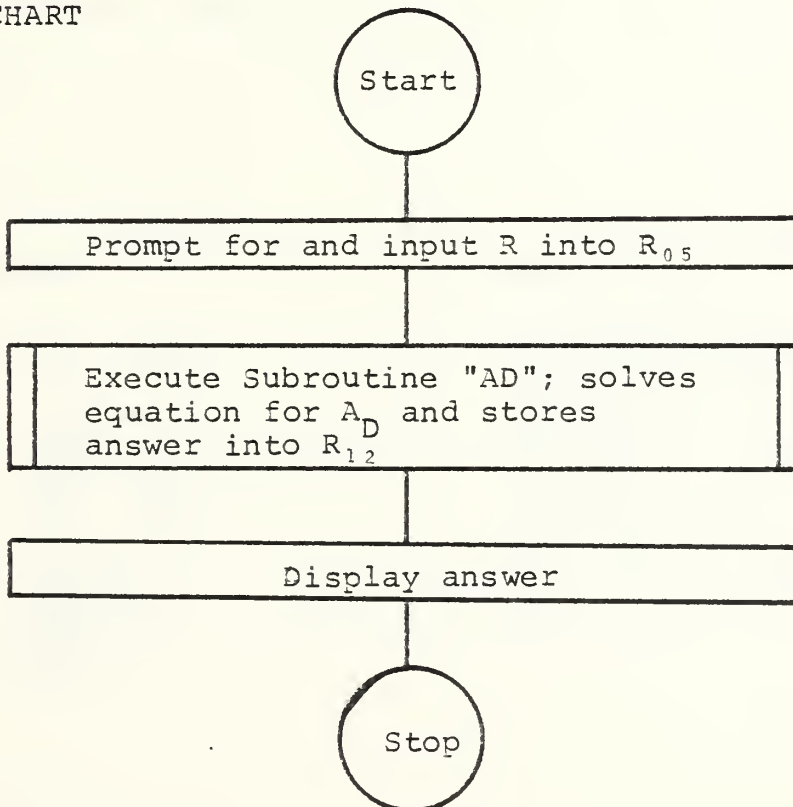

$$A_D = \pi R^2 \quad (4)$$

where:

A_D is the Disc Area (ft^2)

R is the rotor system radius (ft)

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

The rotor radius of the UH-60A Blackhawk is 26.83 feet.

Find the Disc Area.

Keystrokes:

SOLIDITY

1. PURPOSE

This program/subroutine computes solidity, σ_r , the fraction of the disc area that is composed of blades, i.e. solid.

2. EQUATIONS

$$\sigma_r = \frac{b \ c \ R}{\pi \ R^2} = \frac{b \ c}{\pi \ R} \quad (5)$$

where:

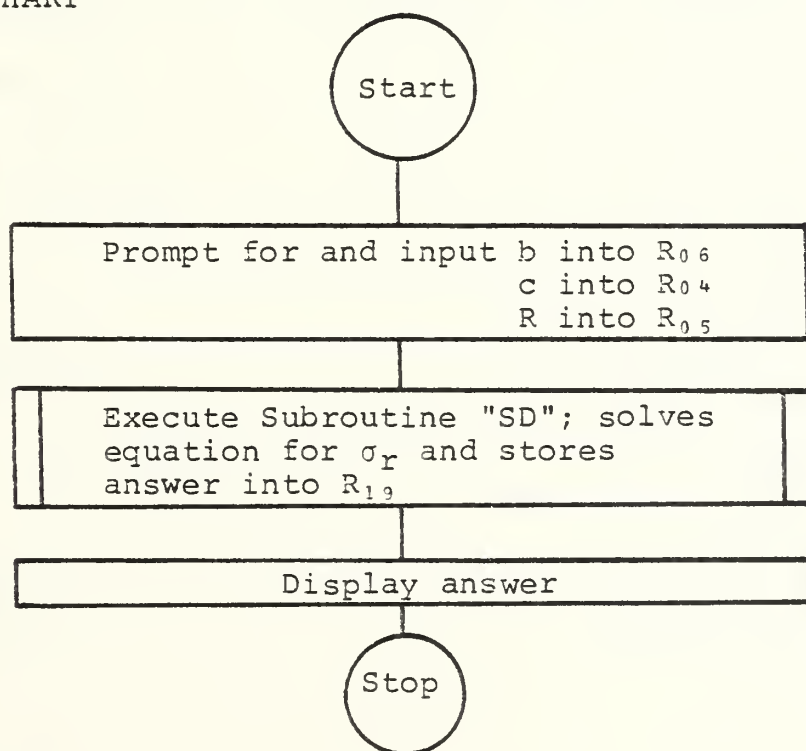

σ_r is the solidity of the rotor system

b is the number of rotor blades in the rotor system

R is the radius of the rotor system (ft)

c is the chord length of the rotor blade (ft)

3. FLOWCHART

4. SAMPLE PROBLEMS AND USER INSTRUCTIONS

Find the solidity, σ_r , of the aft rotor system on the CH-46E Sea Knight (note - the fore and aft rotor systems both have the same dimensions).

INDUCED VELOCITY

1. PURPOSE

This program/subroutine computes the induced velocity, v_i , the total inflow velocity through the rotor system during hover.

2. EQUATIONS

$$v_i = \left[\frac{T}{2\rho \cdot A_D} \right]^{\frac{1}{2}} \quad (7)$$

where:

v_i is the induced velocity (ft/sec)

ρ is the density of the air $\left[\frac{\text{lb} \cdot \text{sec}^2}{\text{ft}^4} \right]$

A_D is the rotor disc area (ft²)

T is the thrust which is equal to the weight, W (lbs)

3. FLOWCHART

TIP LOSS FACTOR

1. PURPOSE

This program/subroutine computes the tip loss factor, B. Tip vortices, at the tip of the rotor blades, tend to despoil the pressure difference at the tips and thereby reduces the lift at the tips. The extent of these losses depends upon the rotor blade loadings, and number of blades. Numerous theories exist. The theory used in this subroutine is an approximation of the tip loss factor made by Prandtl and Betz. [Ref. 1] After the tip loss factor, B, has been computed in the subroutine and returned to the main programs used later, the induced power will change in accordance with the following equation:

$$P_{i_{TL}} = \frac{P_i}{B} \quad (9)$$

where:

$P_{i_{TL}}$ is the induced power with tip losses

P_i is the induced power

B is the tip loss factor

2. EQUATIONS

$$B = 1 - \frac{\sqrt{2C_T}}{b} \quad (10)$$

where:

C_T is the coefficient of thrust

b is the number of rotor blades

B is the tip loss factor

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

Find the tip loss factor, B, for an OH-6A Cayuse operating under the following conditions:

$$N = 470 \text{ RPM} \rightarrow \Omega = 49.21 \text{ radians/sec}$$

EQUIVALENT CHORD

1. PURPOSE

This program is also used as a subroutine by the main programs. This program computes the equivalent chord, C_e , for a tapered rotor blade. A tapered rotor blade (the chord at the tip less than the chord at the root) has less tip loss effect due to the smaller surface area over which the losses may occur; this is the primary reason for tapering the tips of the rotor blades. [Ref. 1]

2. EQUATIONS

The calculation for equivalent chord for thrust determinations has reduced to the following figure and equation:

FIGURE 1
Tapered Rotor Blade

$$C_e = C_1 + \frac{1}{4} \left[\frac{C_0 - C_1}{1 - a} (1 - a^4) \right] \quad (11)$$

where:

C_e is the equivalent chord (ft)

C_0 is the root chord (ft)

C_1 is the tip chord (ft)

a is the fraction of radius where the taper starts
(decimal value)

note - when $a = 0$, the blade has a linear taper from the root to the tip. When $a = 1$, the blade is completely rectangular, and $C_e = C$

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

GROUND EFFECT

1. PURPOSE

This program/subroutine computes the ground effect ratio P/P_{OGE} , as a function of the ratio of the rotor system height above the ground to the diameter of the rotor system. [Ref. 1] FIGURE 2 is a graph which shows the ratio of power required to hover in-ground-effect to that required to hover out-of-ground-effect for the average helicopter. This curve was obtained as the best fit to considerable amounts of test data on both single and tandem rotor helicopters. [Ref. 3]

FIGURE 2
Ground Effect Curve [Ref. 3]

2. EQUATIONS

A curve fitting equation for the plot of FIGURE 2 results in the following equation:

$$\text{G.E. RATIO} = \frac{P}{P_{\text{OGE}}} = \left[-0.1276 (h/D)^4 + 0.7080 (h/D)^3 - 1.4569 (h/D)^2 + 1.3432 (h/D) + 0.5147 \right] \quad (12)$$

where:

h is the height of the rotor system above the ground (ft)

D is the diameter of the rotor system (ft)

P is the power in-ground-effect

P_{OGE} is the power out-of-ground effect

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

The rotor radius of an SH-3H is 31.0 ft. It is currently hovering above the deck of the antisubmarine carrier Yorktown with the rotor system 24.33 ft above the deck (wheels 10 ft above the deck). What is the ground effect ratio?

APPENDIX C

MAJOR SUBROUTINES

This appendix consists of several major subroutines that are called and executed by the main programs of appendix D. These subroutines compute the vertical component of the induced velocity for forward climbing flight; prompt for data input; prompt for change of original data input; compute profile power, induced power, climb power, parasite power, and total power all for a single rotor helicopter; and compute the equivalent area and the induced power requirements for a tandem rotor helicopter.

COEFFICIENTS

1. PURPOSE

This is a Subroutine used by those main programs that deal with forward climbing flight computations. This Subroutine calculates and stores the coefficients of a fourth order equation which Subroutine "VC" will recall and use to solve for the one real root of this equation. This real root is the vertical component of the induced velocity, v_{i_T} , which when multiplied with the thrust, T , gives the product of induced power, P_i , for forward climbing flight.

2. EQUATIONS

$$A(v_{i_T})^4 + B(v_{i_T})^3 + C(v_{i_T})^2 + D(v_{i_T}) + E = 0 \quad (13)$$

where:

$$A = 1.0$$

$$B = 2V_v$$

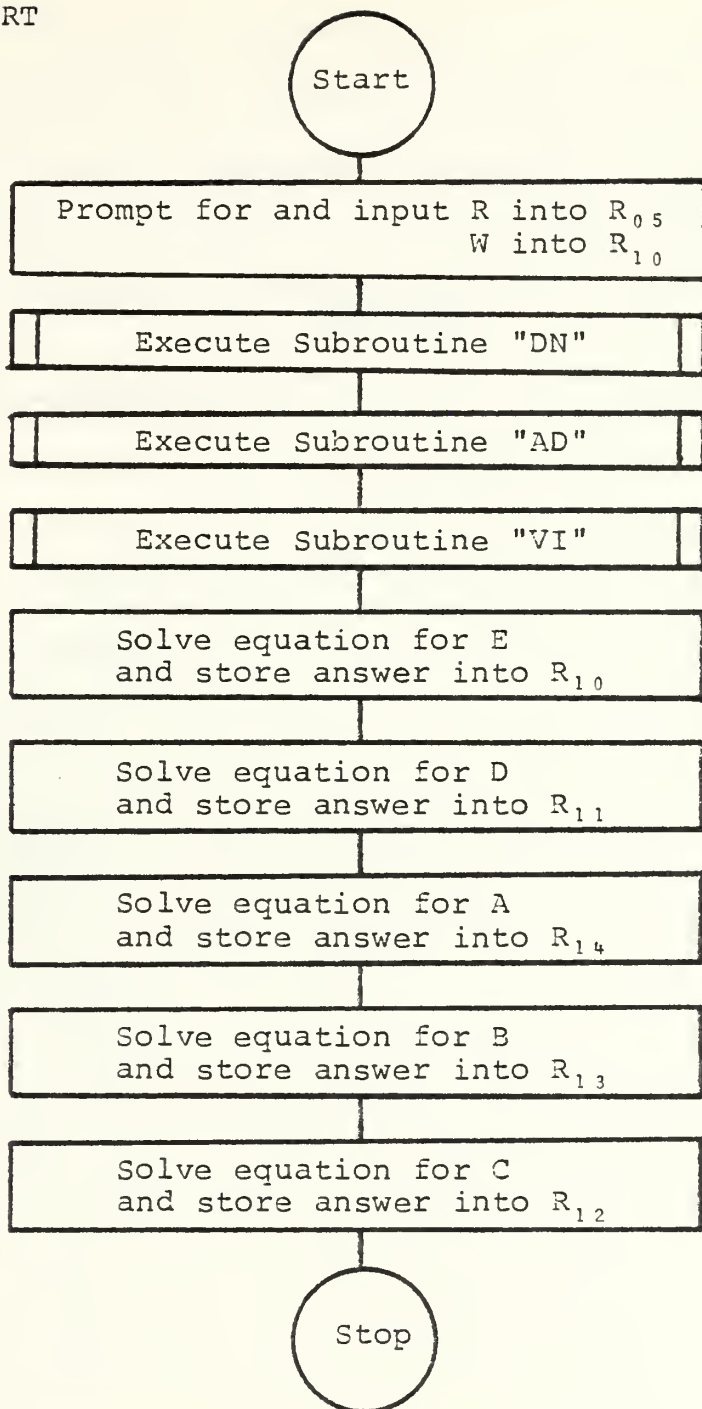

$$C = (V_f^2 + V_v^2)$$

$$D = 0$$

$$E = -v_i^4$$

$$\left. \begin{array}{l} B = 2V_v \\ C = (V_f^2 + V_v^2) \\ D = 0 \end{array} \right\} \begin{array}{l} V_v \text{ is the vertical velocity} \\ \text{(ft/sec)} \\ V_f \text{ is the forward velocity} \\ \text{(ft/sec)} \\ v_i \text{ is the induced velocity} \\ \text{at a hover (ft/sec)} \end{array}$$

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

This subroutine is immediately followed by Subroutine "VC" when used in the main programs. During its computation, Subroutine "VC" uses storage registers R_{00} through R_{19} .

It is therefore necessary to use Subroutine "DATA" at a latter time in the main program in order to get the input data properly stored into the correct memory registers. Because of this, some repetition of input data prompting will occur during main program usage.

VERTICAL COMPONENT OF INDUCED VELOCITY

1. PURPOSE

Subroutine "VC" is a subroutine used by those main programs that deal with forward climbing flight computations. It will immediately follow Subroutine "CF" in the main program listing because Subroutine "VC" recalls the coefficients of a fourth equation that Subroutine "CF" previously calculated. Subroutine "VC" uses the input of these coefficients to solve for the one real root of this fourth order equation. This real root is v_{iT} , the vertical component of the induced velocity through the rotor system for forward climbing flight computations. Subroutine "VC" is a shortened version of Program "MHL". Program "MHL" was obtained from the Catalog of Contributed Programs HP-41C User's Library. [Ref. 5] When given a polynomial with real coefficients, Program "MHL" will use Maehly's Method, a modification of the well-known Newton's Method to find the real roots of the equation. In its original form, Program "MHL" has 131 program steps. This program was modified for use as Subroutine "VC" with 105 program steps.

2. EQUATIONS

See Subroutine "CF" for a complete description of the fourth order equation that Subroutine "VC" solves.

Neither the equations used in the iterative root solving process are shown, nor is a flowchart for this process shown.

A complete description of this process is available from the HP-41C User's Library Catalog, Program Number 00660C. [Ref. 5]

3. FLOWCHART

none

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

The user may wonder why Subroutine "CF" and Subroutine "VC" were not combined into one subroutine. Subroutine "VC" has previously appeared in several different forms. Each form has solved the fourth order polynomial using a different technique. Subroutine "VC" currently exists in the shortest form found; both in number of program steps and program running time. Perhaps the user of this subroutine is aware of an even shorter process and can thus modify this subroutine even farther. It is important to remember here that one of the primary reasons for the use of subroutines was for ease of program editing and modification.

DATA

1. PURPOSE

This is a subroutine used by all main programs for data input, and depending upon the looping involved, some programs will use this subroutine more than once. In some very few instances, not every item of data that the calculator prompts for is required for program execution. In these few instances, the EXAMPLE PROBLEMS AND USER INSTRUCTIONS sections are very explicit in the correct procedures to be taken for data input. The primary reason in the repetitive use of this subroutine is to save program steps and calculator memory. Alpha characters and operators, the main ingredient of this subroutine, are more costly in storage requirements (bytes) than the typical numerical operators that are used throughout these programs. [Ref. 4]

2. EQUATIONS

none

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

No equations are used, but this subroutine prompts for the following input where:

Display:	Explanation:
REC?	asks if the rotor blade is of rectangular planform 1 [R/S] if the answer is yes
C=?	asks for the blade chord (ft) 0 [R/S] if the answer is no
C0=?	asks for the root chord (ft)
C1=?	asks for the tip chord (ft)
a=?	asks for the fraction of radius of the rectangular portion of the blade (decimal value)
R=?	asks for the rotor disc radius (ft)
b=?	asks for the total number of individual blades in the rotor system
Cd0=?	asks for the average profile drag coefficient, $\overline{C_{d0}}$
RV=?	asks for the rotational velocity, Ω (radians/sec)
H=?	asks for the rotor system height above the ground, h (ft)
W=?	asks for the weight of the helicopter (lbs)
D.A.=?	asks for the density altitude, h_p (ft)

CHANGE

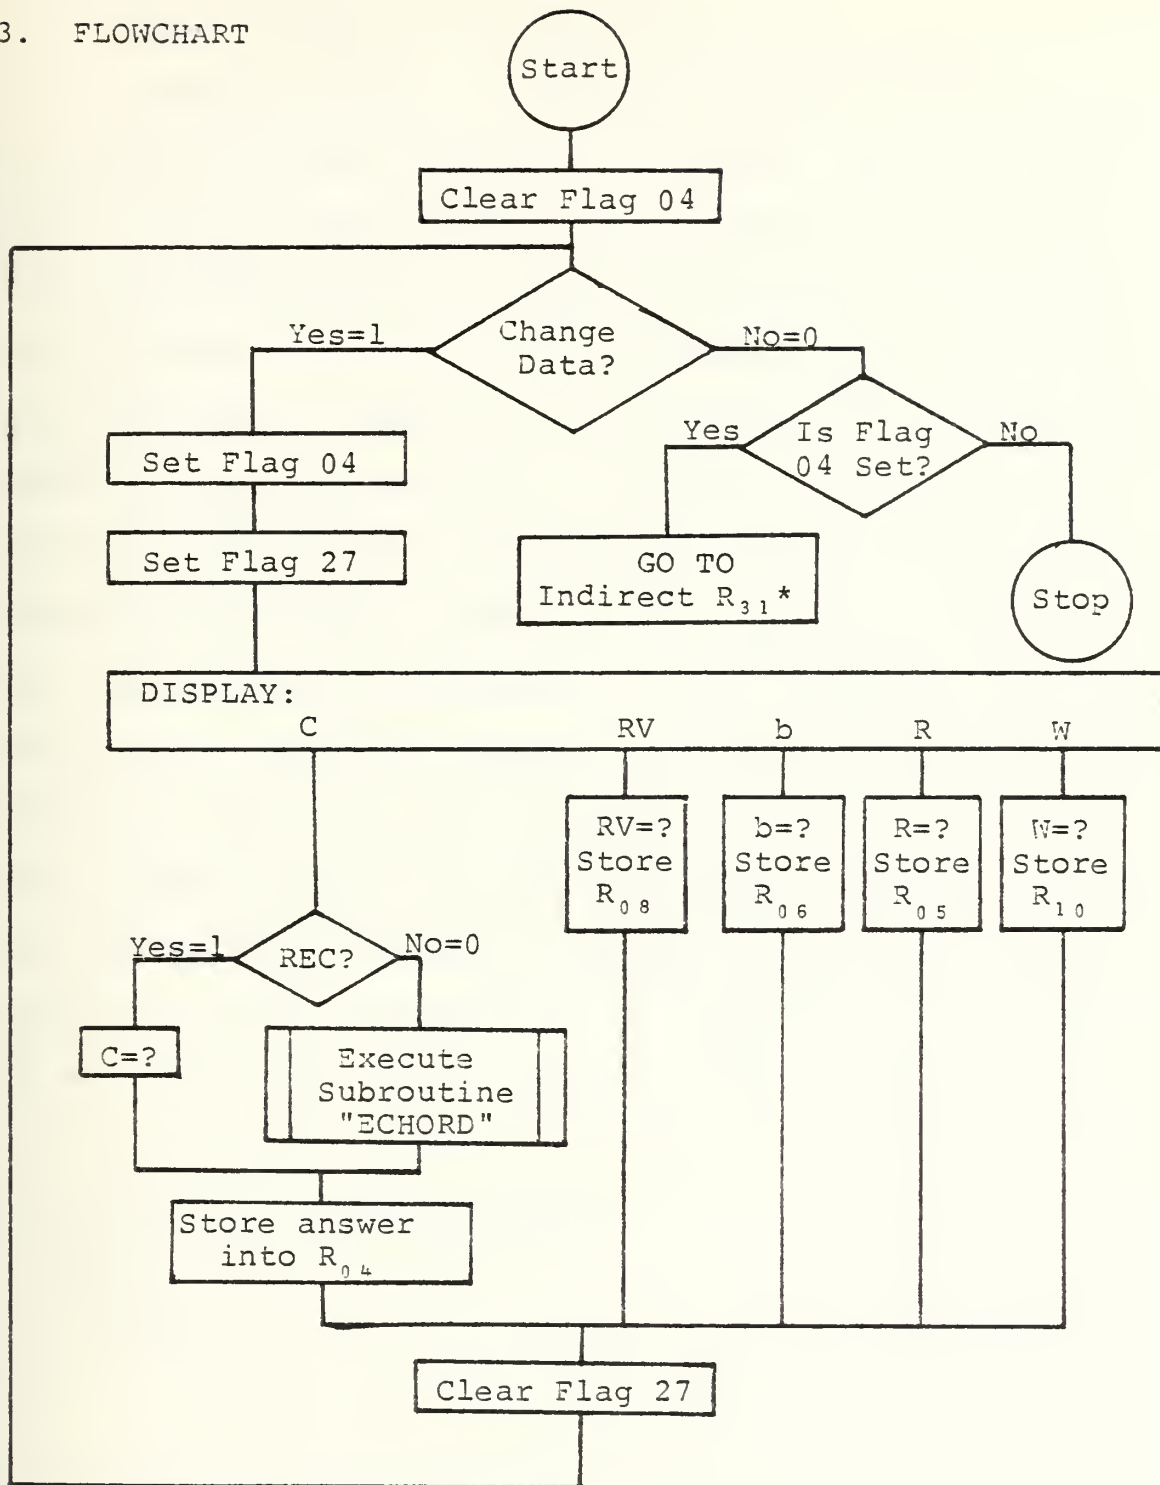

1. PURPOSE

This is a subroutine used by all main programs for expediting the change of input data. This subroutine is the last step in the main program listing before program termination. This subroutine allows for as many as five of the input variables to be quickly changed before returning to the top of the main program listing and initiating a new program operation. Upon examining the program listing for this subroutine, it will become quickly apparent to the user the ease of which this subroutine could be edited for other desired changes. Again, this is one of the purposes and obvious advantages of using subroutines throughout these programs.

2. EQUATIONS

none

3. FLOWCHART

* Returns to and reruns the main program with new data

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

No sample problem is given here because of the numerous examples that exist in the main programs. Note that when flag 27 is set, this automatically places the calculator into the [USER] mode. By pressing the key directly below the displayed variable in need of change, will next cause the calculator to prompt for the new data input. The new numeric value is then keyed in followed by [R/S]. The calculator will again prompt in the display for another change of data with: "CHANGE?". The user should remember that here as well as elsewhere in these programs, yes is 1 and no is 0. When all changes have been made and the answer no is received, the calculator will then return to the main program and begin execution with the new data. If on the initial time through, no changes are desired, and the answer no is given (notice from the flow chart that flag 04 has not been set), the main program will terminate operation.

PROFILE POWER

1. PURPOSE

This subroutine computes the profile power, P_o , required in terms of horsepower. Profile power is that power required to turn the rotor blades against their drag.

2. EQUATIONS

$$P_{Oh} = \frac{1}{8} \cdot \sigma_r \cdot \overline{C_{dO}} \cdot \rho \cdot A_D \cdot V_T^3 \quad (14)$$

$$\mu = V_f / V_T \quad (15)$$

$$P_{Of} / P_{Oh} = (1 + 4.25\mu^2) \quad (16)$$

where:

P_{Oh} is the profile power required to hover $\left[\frac{\text{ft-lb}}{\text{sec}} \right]$

P_{Of} is the profile power required in forward flight $\left[\frac{\text{ft-lb}}{\text{sec}} \right]$

$\overline{C_{dO}}$ is the average profile drag coefficient

A_D is the area of the rotor disc (ft^2)

V_T is the tip velocity (ft/sec)

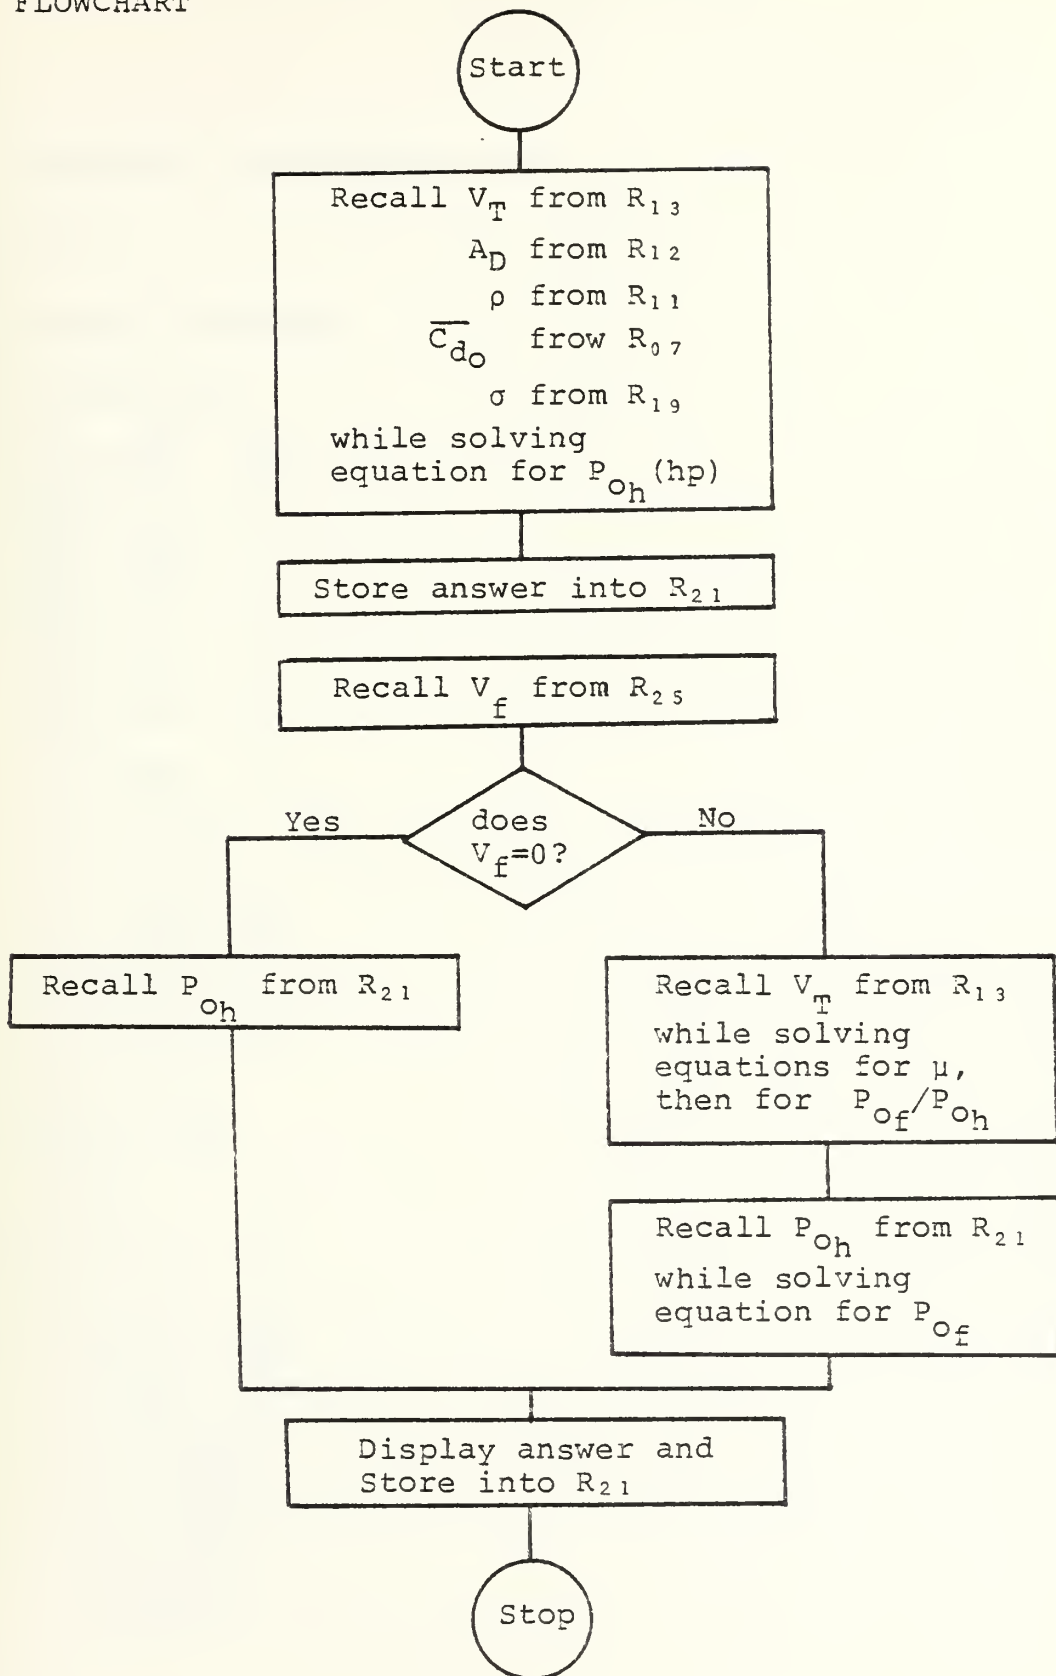

V_f is the forward velocity of the helicopter (ft/sec)

σ_r is the solidity of the rotor system

μ is the ratio of the rotor translational velocity to the velocity at the tip due to rotation

ρ is the density of the air $\left[\frac{\text{lb-sec}^2}{\text{ft}^4} \right]$

INDUCED POWER

1. PURPOSE

This subroutine computes the induced power, P_i , required in terms of horsepower. This subroutine deals only with hover and it takes into consideration both tip losses and ground effect. The induced power which produces a thrust equal to the weight (at hover) is equal to the product of the thrust and the inflow velocity. All of the main programs compute the inflow velocity peculiar to their flight conditions and will enter this subroutine at Label "PJ" or "TJ".

2. EQUATIONS

$$P_i = T \cdot v = T \sqrt{T / 2\rho \cdot A_D} = \frac{T^{1.5}}{\sqrt{2\rho \cdot A_D}} \quad (17)$$

$$P_{i_{TL}} = \frac{P_i}{B} \quad (9)$$

$$\text{G.E. RATIO} = \frac{P_i}{P_{i_{OGE}}} \quad (12)$$

where:

T is the thrust which is equal to the weight, W (lb)

v is the induced velocity (ft/sec)

B is the tip loss factor

ρ is the density of the air $\left[\frac{\text{lb-sec}^2}{\text{ft}^4} \right]$

A_D is the disc area (ft²)

P_i is the induced power $\left[\frac{\text{ft-lb}}{\text{sec}} \right]$

P_{iTL} is the induced power with tip losses $\left[\frac{\text{ft-lb}}{\text{sec}} \right]$

P_{iOGE} is the induced power under out-of-ground-effect conditions $\left[\frac{\text{ft-lb}}{\text{sec}} \right]$

G.E.
RATIO is the ground effect ratio

CLIMB POWER

1. PURPOSE

This subroutine computes the climb power, P_c , required in terms of horsepower.

2. EQUATIONS

$$P_c = T \cdot V_v \quad (18)$$

where:

P_c is climb power $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

T is the thrust which is equal to the weight, W (lb)

V_v is the vertical velocity (ft/sec)

PARASITE POWER

1. PURPOSE

This subroutine computes the parasite power, P_p , required in terms of horsepower. As the helicopter proceeds from hover into forward flight, drag forces are created on the various components of the helicopter due to pressure drag and skin friction.

2. EQUATIONS

$$P_p = \frac{1}{2}\rho f_v V_v^3 + \frac{1}{2}\rho f_f V_f^3 \quad (19)$$

where:

P_p is the parasite power $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

f_v is the equivalent flat plate area for vertical flight (ft^2)

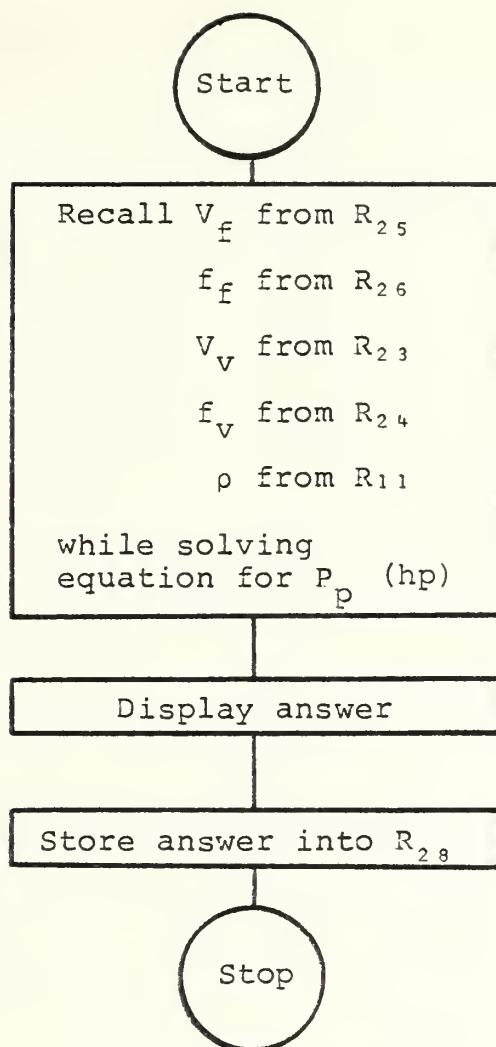

f_f is the equivalent flat plate area for forward flight (ft^2)

V_v is the vertical velocity (ft/sec)

V_f is the forward velocity (ft/sec)

ρ is the density of the air $\left[\frac{\text{lb}\cdot\text{sec}^2}{\text{ft}^4} \right]$

TOTAL POWER

1. PURPOSE

This subroutine computes the total power, P_T , required for the main rotor in terms of horsepower.

2. EQUATIONS

$$P_T = P_i + P_o + P_c + P_p \quad (20)$$

where:

P_T is the total power required

P_i is the induced power required

P_o is the profile power required

P_c is the climb power required

P_p is the parasite power required

TANDEM ROTOR INDUCED POWER

1. PURPOSE

This subroutine computes the induced power required for a tandem rotor helicopter in terms of horsepower. This subroutine will compute both the induced power at a hover, P_{i_h} , and the induced power in forward flight, P_{i_f} .

2. EQUATIONS

$$P_{i_h} = \frac{T^{1.5}}{\sqrt{2 \cdot \rho \cdot A_e}} \cdot K \quad (26)$$

$$K = 1.46 - 0.253 S_R \quad (27)$$

$$P_{i_f} = P_{i_h} \cdot K_u \quad (28)$$

$$K_u = 1 + d_f/2 \quad (29)$$

$$S_R = d/R \quad (22)$$

$$\gamma = \tan^{-1} \left(\frac{1.5 T_f}{2 \cdot \rho \cdot A_f \cdot V_f^2} \right) \quad (30)$$

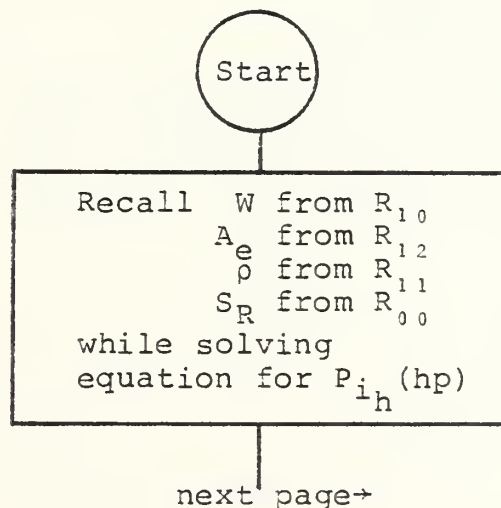

$$d_f = \frac{\sqrt{1 + S_R^2} + S_R \cdot \cos \gamma}{\sqrt{1 + S_R^2} (1 + S_R^2 \cdot \sin^2 \gamma)} \quad (31)$$

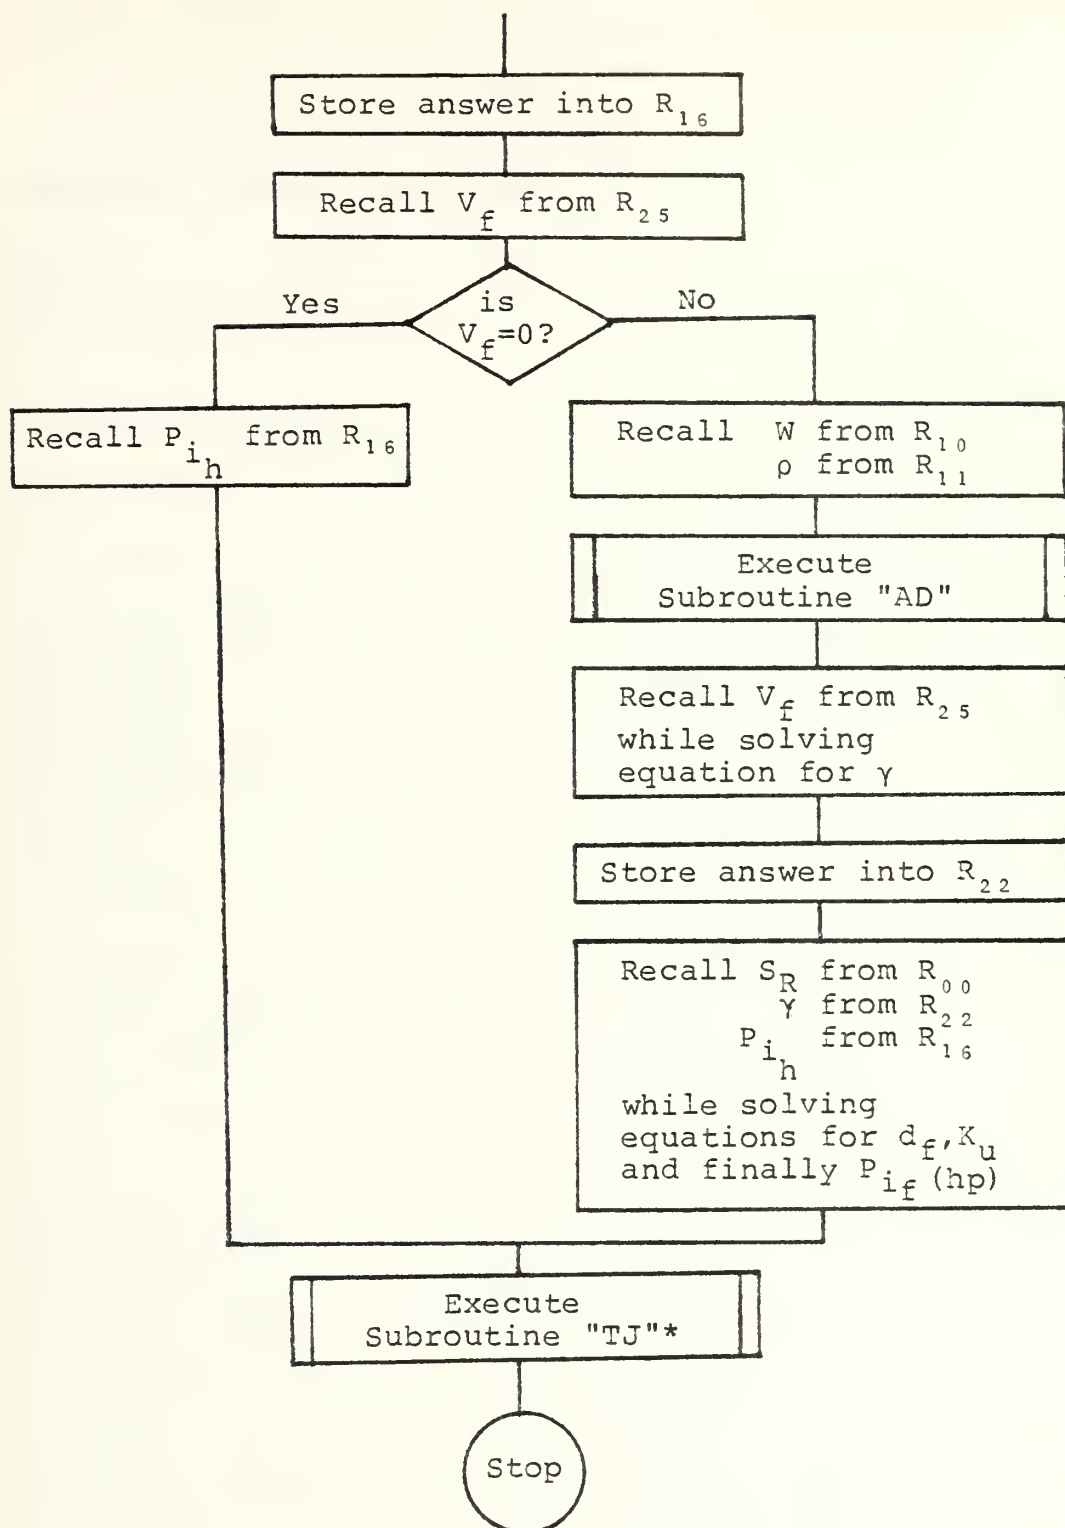

where:

P_{i_h} is the induced power at a hover $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

P_{i_f} is the induced power in forward flight $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$
 A_e is the effective area (ft^2)
 A_f is the area of the forward rotor disc (ft^2)
 d_f is the induced power correction factor
 K_u is the forward flight correction factor
 S_R is the rotor shaft spacing ratio
 T_f is the thrust of the forward rotor which is
 usually equal to $\frac{1}{2}W$, the weight (lb_f)
 V_f is the forward velocity (ft/sec)
 K is the ratio of the induced power at a hover for
 a single rotor helicopter as compared to a tandem
 d is the distance between the rotor shafts (ft)
 R is the radius of the rotor system (ft)
 T is the thrust which is equal to the weight, W (lb_f)
 γ is the wake skewing angle
 ρ is the density of the air $\left[\frac{\text{lb-sec}^2}{\text{ft}^4} \right]$

APPENDIX D

MAIN PROGRAMS

This appendix consists of the main programs of this programming effort. The major ingredients of these programs are the subroutines found in the preceding two appendices. These main programs compute the various power requirements for hovering flight, forward (straight and level) flight, vertical flight, and forward climbing flight all for a single rotor helicopter; also tailrotor power requirements; autorotative flight; tandem rotor hovering and forward flight power requirements; and finally a short program to check several of the critical flight parameters.

HOVER

1. PURPOSE

This main program computes the various power requirements in terms of horsepower for hovering flight. The various calculated power requirements are displayed as follows:

Display:	Explanation:
PI=	induced power
PI(TL)=	induced power with tip losses
PI(TL+GE)=	induced power with tip losses plus ground effect
PO=	profile power
PT(MR)=	total power for the main rotor

2. EQUATIONS

No equations are found in the actual program itself. Consult the various subroutine listings for the equations used.

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

Find the hover power requirements for an OH-58C, Kiowa,
under the following conditions:

$$C = 1.086 \text{ ft}$$

$$\Omega = 354 \text{ RPM} \rightarrow 37.068 \text{ rads/sec}$$

$$R = 17.7 \text{ ft}$$

$$h = 25 \text{ ft}$$

$$b = 2$$

$$\text{D.A.} = 1,000 \text{ ft}$$

$$W = 3,000 \text{ lbs}$$

$$\bar{C}_{dO} = .008$$

FORWARD FLIGHT

1. PURPOSE

This main program computes the various power requirements in terms of horsepower for forward (straight and level) flight. If the forward flight velocity, V_f , is entered as zero, this program will also calculate the various hover power requirements. The various calculated power requirements are displayed as follows:

Display:	Explanation:
PI=	induced power
PI(TL)=	induced power with tip losses
PI(TL+GE)=	induced power with tip losses plus ground effect
PO=	profile power
PP=	parasite power
PT(MR)=	total power for the main rotor

2. EQUATIONS

$$V_f \text{ (ft/sec)} = V_f \text{ (kts)} \cdot (1.68894) \quad (32)$$

$$P_i = T \cdot v_{iT} = T \cdot \left\{ -\frac{V_f^2/V_i^2}{2} + \sqrt{(V_f^2/2V_i^2)^2 + 1} \right\}^{\frac{1}{2}} \cdot v_i \quad (33)$$

where:

T is the thrust which is equal to the weight, W (lb_f)

V_f is the forward velocity (ft/sec)

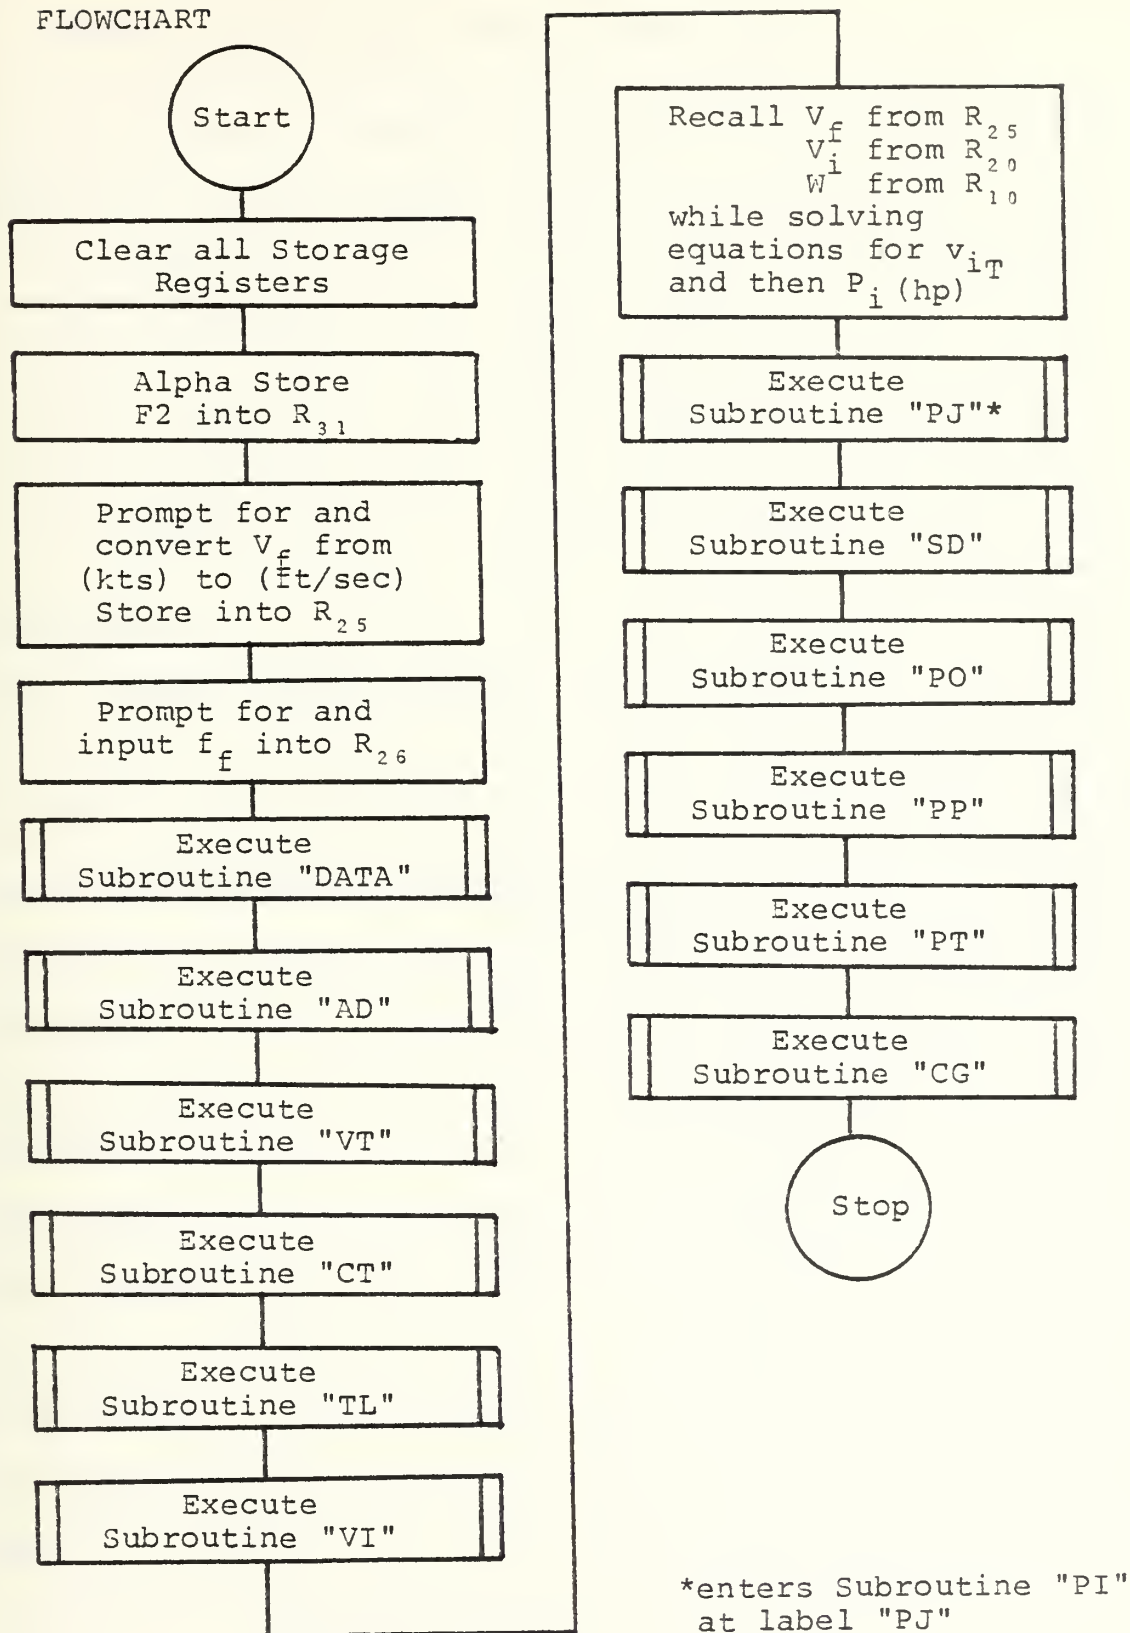

v_i is the induced velocity at a hover (ft/sec)

P_i is the induced power required $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

v_{iT} is the thrust component of the induced velocity
vector (ft/sec)

No other equations are found in the actual program itself. Consult the various subroutine listings for the equations used.

VERTICAL FLIGHT

1. PURPOSE

This main program computes the various power requirements in terms of horsepower for vertical flight (vertical ascent). If the vertical velocity, V_v , is entered as zero, this program will also calculate the various hover power requirements. The various calculated power requirements are displayed as follows:

Display:	Explanation:
PI=	induced power
PI(TL)=	induced power with tip losses
PI(TL+GE)=	induced power with tip losses plus ground effect
PO=	profile power
PP=	parasite power
PC=	climb power
PT(MR)=	total power for the main rotor

2. EQUATIONS

$$V_v \text{ (ft/sec)} = V_v \text{ (ft/min)} \cdot 60 \quad (34)$$

$$v_v = -\frac{V_v}{2} + \sqrt{(V_v/2)^2 + v_{ih}^2} \quad (35)$$

$$P_{i_c} = T \cdot v_v \quad (36)$$

where:

T is the thrust which is equal to the weight, W (lb_f)

v_v is the induced velocity due to pumping in a
vertical climb (ft/sec)

V_v is the steady rate of climb velocity (ft/sec)

v_{ih} is the induced velocity at a hover (ft/sec)

P_{ic} is the induced power required to climb $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

No other equations are found in the actual program itself. Consult the various subroutine listings for the equations used.

FLIGHT

1. PURPOSE

This main program computes the various power requirements in terms of horsepower for forward climbing flight. If the vertical velocity, V_v , is entered as zero, this program will compute the various power requirements for forward (straight and level) flight. If the forward velocity, V_f , is entered as zero, this program will compute the various power requirements for vertical flight. If both the vertical velocity, V_v , and the forward velocity, V_f , are entered as zero, this program will compute the various power requirements for hovering flight. The various calculated power requirements are displayed as follows:

Display:	Explanation:
PI=	induced power
PI(TL)=	induced power with tip losses
PI(TL+GE)=	induced power with tip losses plus ground effect
PO=	profile power
PP=	parasite power
PC=	climb power
PT(MR)=	total power for the main rotor

2. EQUATIONS

$$V_f \text{ (ft/sec)} = V_f \text{ (kts)} \cdot (1.68894) \quad (32)$$

$$P_i = T \cdot v_{iT} \quad (33)$$

$$V_v \text{ (ft/sec)} = V_v \text{ (ft/min)} \cdot 60 \quad (34)$$

where:

T is the thrust which is equal to the weight, W (lb_f)

P_i is the induced power $\frac{\text{ft-lb}_f}{\text{sec}}$

V_v is the vertical velocity (ft/sec)

V_f is the forward velocity (ft/sec)

v_{iT} is the vertical component of the induced velocity (ft/sec)

No other equations are found in the actual program itself. Consult the various subroutine listings for the equations used.

0 [R/S]	0.00

note - When program "HOVER" is executed for this case, the outputs are identical. Examination of subroutine "CF" and subroutine "VC" with $V_f = 0$, and $V_v = 0$, explains the reason for the identical results.

The user of program "FLIGHT" might wonder at this time as to why it is even necessary to have programs "HOVER", "FORFLT", and "VERFLT" when it has now become obvious that program "FLIGHT" will do all three cases. Three reasons exist to substantiate the existence of these other three programs. First, program "FLIGHT" is a long program and, as such, requires 31 more program registers than any of the other three. Second, program "FLIGHT" has a longer running time than any of the other three. Subroutine "VC" alone will take an average of 30 seconds of execution time. And third, program "FLIGHT" involves some double prompting for the same input. The reasons for this were explained in subroutines "DATA and "CF". This procedure optimizes the use of data registers, but also increases the execution time.

Therefore, if the user's only desire is to execute pure hover, or forward flight, or vertical flight computations, then one of these other programs should be used. Both calculator memory space and calculator execution time will be significantly reduced.

TAILROTOR

1. PURPOSE

This main program computes the various tailrotor power requirements in terms of horsepower under all types of flight conditions. The tailrotor program must be executed immediately following the execution of any of the main rotor programs such as "HOVER", "FORFLT", "VERFLT", or "FLIGHT". The tailrotor program recalls and uses much of the information that the previously executed program has put into storage. By doing this, the tailrotor program is shortened. There is no need for regurgitation of input data and calculations for the main rotor, which is the starting point for all tailrotor computations. The various calculated power requirements are displayed as follows:

Display:	Explanation:
PI=	induced power for the tailrotor
PI(TL)=	induced power with tip losses for the tail- rotor
PO=	profile power for the tailrotor
PT(TR)=	total power for the tailrotor
PT(MR)=	total power for the main rotor
PT(ACFT)=	total power for the aircraft

2. EQUATIONS

$$P_{i(tr)} = T_{(tr)} \cdot v_{i(tr)} \quad (37)$$

$$T_{(tr)} = \frac{P_{(mr)}/\Omega_{(mr)}}{\ell_{tr}} \quad (38)$$

$$v_{i_f(tr)} = \left\{ -\frac{V_f^2}{2} + \left[\left(\frac{V_f^2}{2} \right)^2 + \frac{P_f^2}{(2A_{D(tr)} \ell_{tr} \Omega_{(mr)} \rho)^2} \right]^{\frac{1}{2}} \right\}^{\frac{1}{2}} \quad (39)$$

$$v_{i(tr)} = \frac{P_{h(mr)}}{(2A_{D(tr)} \ell_{tr} \Omega_{(mr)} \rho)} \quad (40)$$

$$P_{i_f(tr)} = T_{(tr)} \cdot v_{i_f(tr)} \quad (41)$$

$$P_{o_f(tr)} = \frac{1}{8} \sigma_{(tr)} \bar{C}_{d_o(tr)} \rho A_{D(tr)} V_{T(tr)}^3 \left[1 + 4.3 \left(\frac{V_f}{V_{T(mr)}} \right)^2 \right] \quad (42)$$

where:

$v_{i_f(tr)}$ is the induced velocity of the tailrotor
in forward flight (ft/sec)

$P_{i_f(tr)}$ is the induced power required by tailrotor
forward flight $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

$P_{o_f(tr)}$ is the profile power required by the tail-
rotor in forward flight $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

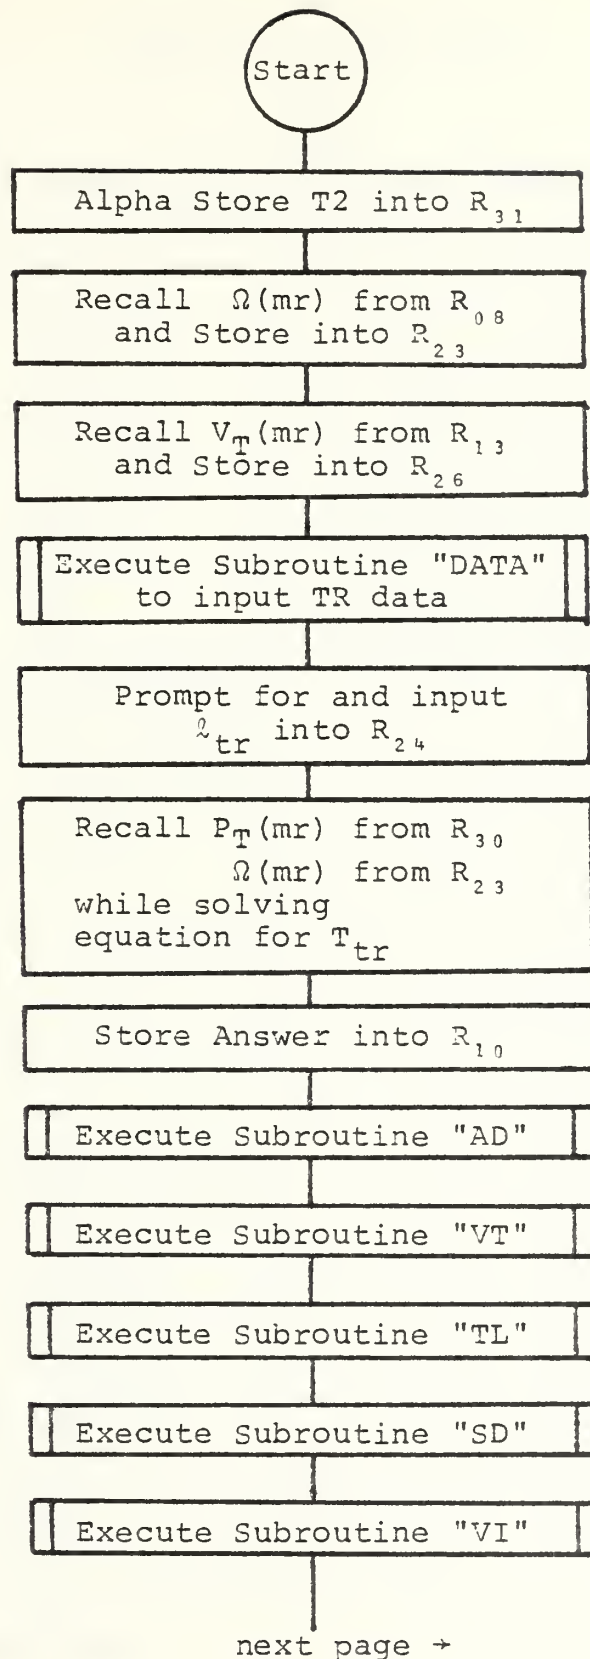

$\bar{C}_{d_o(tr)}$ is the average profile drag coefficient
of the tailrotor

$P_{h(mr)}$ is the total power required by the main rotor
in hover $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$

$A_{D(tr)}$ is the disc area of the tailrotor (ft²)

$V_{T(tr)}$ is the tip velocity of the tailrotor (ft/sec)
 $V_{T(mr)}$ is the tip velocity of the main rotor (ft/sec)
 $v_i(tr)$ is the induced velocity of the tailrotor at
a hover (ft/sec)
 $P_i(tr)$ is the induced power required by the tail-
rotor at a hover $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$
 $T_{(tr)}$ is the required thrust for the tailrotor (lb_f)
 $\Omega_{(mr)}$ is the rotational velocity of the main rotor
system (radians/sec)
 $\sigma_{(tr)}$ is the solidity of the tailrotor
 $P_{(mr)}$ is the total power required by the main
rotor $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$
 ℓ_{tr} is the tail length, the distance from the center
of the main rotor system to the center of the
tailrotor system (ft)
 P_f is the total power required by the main rotor
in forward flight $\left[\frac{\text{ft-lb}_f}{\text{sec}} \right]$
 V_f is the forward velocity of the helicopter (ft/sec)
 ρ is the density of the air $\left[\frac{\text{lb-sec}^2}{\text{ft}^4} \right]$

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

Find the tailrotor power requirements for an SH-3H, Sea King, conducting a "LAMPS" mission while hovering above the surface of the ocean under the following flight conditions:

$$W = 18,650 \text{ lbs}$$

$$h = 54 \text{ ft}$$

$$D.A. = 0 \text{ ft}$$

$$l_{tr} = 36.6 \text{ ft}$$

Main Rotor Data:

$$C = 1.52 \text{ ft}$$

$$R = 31 \text{ ft}$$

$$b = 5$$

$$\bar{C}_{d_o} = .0095$$

$$\Omega = 203 \text{ RPM} \rightarrow 21.26 \frac{\text{rads}}{\text{sec}}$$

Tail Rotor Data:

$$C = 0.61 \text{ ft}$$

$$R = 5.3 \text{ ft}$$

$$b = 5$$

$$\bar{C}_{d_o} = .0105$$

$$\Omega = 1243 \text{ RPM} \rightarrow 130.16 \frac{\text{rads}}{\text{sec}}$$

[R/S]	CHANGE?
1 [R/S]	C RV b R W

It is desired at this point to increase the length of the tail, l_{tr} , from 36.6 to 41.6 feet. To observe what effect this change will have on the tailrotor power requirements flag 04 must be set to return to the main program where it then becomes possible to change l_{tr} . The flowchart for subroutine "CG" depicts this process. In order to initiate this procedure, pick a variable and input its original value. In this example, b is used:

[\sqrt{x}]	b=?
5 [R/S]	CHANGE?
0 [R/S]	L(TAIL)=?
41.6 [R/S]	PI=
[R/S]	85.07

note - the CHANGE? process can be executed as many times as the user may desire, but the whole of program "TR" can only be executed once. By examining the flowchart for this program, it can be seen that several main rotor data elements are moved about in the storage registers. This is done to conserve program memory. Therefore, it becomes necessary to go back and execute one of the other main rotor programs before again attempting to execute program "TR" in its entirety.

AUTOROTATION

1. PURPOSE

This main program computes several values for a single rotor helicopter in vertical and forward flight autorotation. The computed values are displayed as follows:

Display:	Explanation:
VV=	vertical velocity in a vertical autorotation (ft/min)
VF(MIN.R.O.D.)=	forward autorotative flight velocity for minimum autorotative rate of descent (kts)
VV(MIN.R.O.D.)=	vertical autorotative velocity (ft/min) at the forward autorotative flight velocity for minimum autorotative rate of descent
d(HOR.GLIDE)=	horizontal distance travelled on the ground at the forward autorotative flight velocity for minimum rate of descent (ft)

2. EQUATIONS

$$\bar{C}_L = (3K_2/K_1)^{\frac{1}{2}} \quad (43)$$

$$\bar{C}_d = K_1 \bar{C}_L^2 + K_2 \quad (44)$$

$$\bar{F} = \frac{(C_L^3/C_d^2) \cdot \sigma}{4} \quad (45)$$

$$V_v = \left[\frac{W}{2 \cdot \rho \cdot A_D \cdot \bar{F}} \right]^{\frac{1}{2}} \quad (46)$$

$$\bar{F} = \frac{\bar{F}}{(1 + \bar{F})^2} \quad (0 < \bar{F} < 1) \text{ Momentum Theory} \quad (47)$$

$$\bar{F} = \frac{(2\bar{F} - \sqrt{3\bar{F}})}{(4\bar{F} - 3)} \quad (\bar{F} > 1) \text{ Glauert Equation} \quad (48)$$

$$V_{f(\text{min ROD})} = 0.00867 \cdot R \cdot \text{RPM} \quad (49)$$

$$V_{v(\text{min ROD})} = 0.251 \cdot R \cdot \text{RPM} \quad (50)$$

$$d_{(\text{hor glide})} = \frac{h}{\tan \gamma} \quad (51)$$

$$\gamma = \arcsin \frac{V_v}{V_f} \approx 16.6^\circ \quad (52)$$

where:

\bar{C}_L is the average coefficient of lift

\bar{C}_D is the average coefficient of drag

K_1 is a real number coefficient called the lift coefficient multiplier in drag coefficient terms

K_2 is a real number coefficient equal to C_{D_0}

V_v is the vertical velocity in a vertical autorotation (ft/min)

A_D is the area of the rotor disc (ft²)

σ is the solidity of the main rotor system

ρ is the density of the air $\left[\frac{\text{lb-sec}^2}{\text{ft}^4} \right]$

h is the height of the rotor system above the ground (ft)

$V_{f(\text{min ROD})}$ is the forward autorotative flight velocity for minimum autorotative rate of descent (kts)

$V_{v(\text{min ROD})}$ is the vertical autorotative velocity (ft/min) at the forward autorotative flight velocity for minimum autorotative rate of descent

$d_{(\text{hor glide})}$ is the horizontal distance travelled on the ground (ft) at the forward autorotative flight velocity for minimum rate of descent

RPM is the rotational velocity of the main rotor system in revolutions/minute

\bar{F} is a non-dimensional coefficient

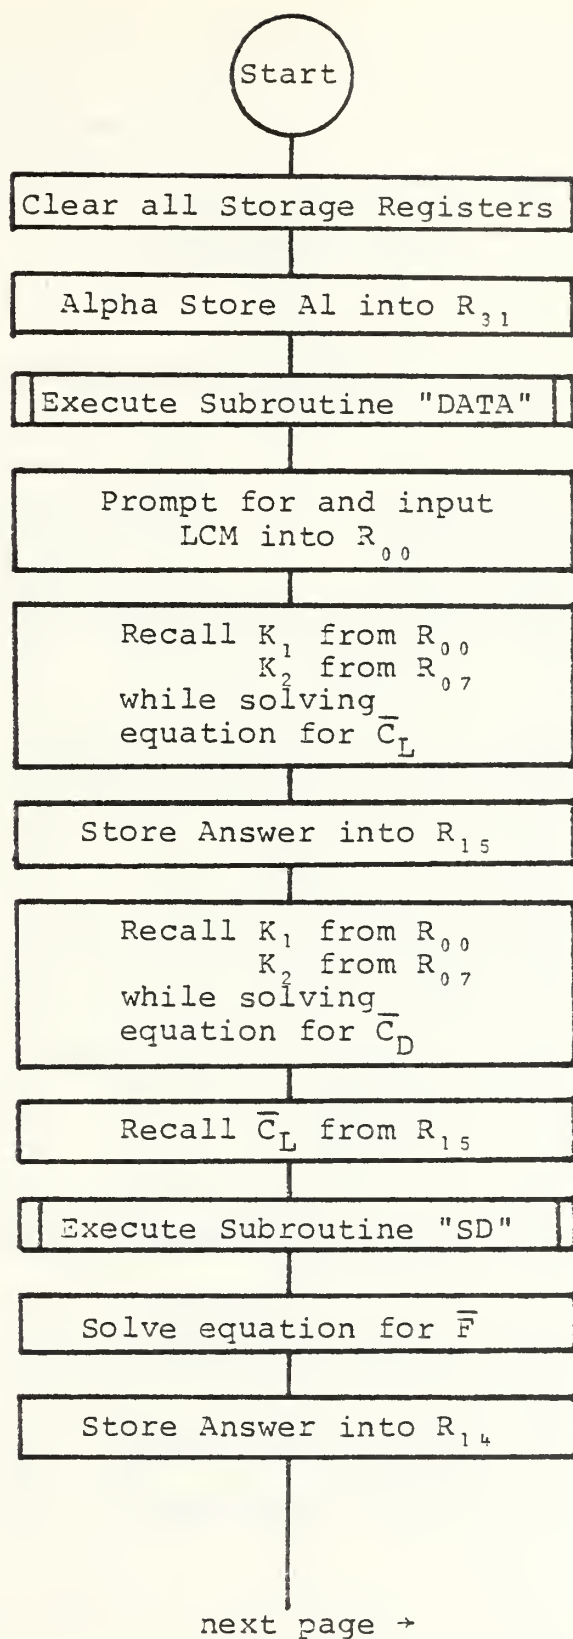

\bar{f} is a non-dimensional coefficient

W is the weight of the helicopter (lbs)

R is the radius of the rotor system (ft)

γ is the descent angle for minimum descent rate (degrees)

3. FLOW CHART

next page →

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

note - if the display "F=" should appear, an error has been made in either the design or the input data itself. This will only occur when $\bar{F} \leq 0$. Neither this program nor the theory used will be able to calculate results for this situation.

For a UH-1H, Iroquois, with the following characteristics:

W = 8,200 lbs

NACA 0012 Main Rotor Blade:

h = 1,500 ft

R = 24 ft

b = 2

C = 1.75 ft

D.A. = 1,500 ft

$C_d = .0098 + .0120C_L^2$

$$\Omega = 324 \text{ RPM} \rightarrow 33.927 \text{ radians/sec}$$

find the rate of descent in a vertical autorotation, V_v ; the forward flight autorotative velocity for minimum rate of descent, $V_{f(\text{min ROD})}$; the vertical velocity for the minimum rate of descent, $V_{v(\text{min ROD})}$; and the horizontal glide distance travelled during the autorotation, $d_{(\text{hor glide})}$.

[R/S]	67.42
[R/S]	VV(MIN.R.O.D.)=
[R/S]	2043.85
[R/S]	d(HOR.GLIDE)=
[R/S]	5031.70
[R/S]	CHANGE?

It is now desired to decrease the rotor rotational velocity from 33.927 to 32.88 radians/second. This is 314 RPM.

1 [R/S]	C RV b R W
[1/x]	RV=?
32.88 [R/S]	CHANGE?
0 [R/S]	VV=
[R/S]	3106.02
[R/S]	VF(MIN.R.O.D.)=
[R/S]	65.34
[R/S]	VV(MIN.R.O.D.)=
[R/S]	1980.77
[R/S]	d(HOR.GLIDE)=

[R/S]	5031.70
[R/S]	CHANGE?
0 [R/S]	0.00

note - A reduced rate of descent during a forward flight autorotation can be achieved by attaining as low a rotor speed as possible without exceeding published limits (stall). Below a certain rotational velocity, rate of descent increases again, and the higher the weight, the higher the RPM at which this reversal occurs. [Ref. 6] Also, the forward speed for minimum descent rate is not the same forward speed for maximum glide distance. The forward speed for maximum glide distance will be higher than the forward speed for minimum descent rate. This "stretching the glide" not only results in a longer horizontal glide distance, but also results in an increased rate of descent. [Ref. 6]

TANDEM

1. PURPOSE

This main program computes the various power require-
in terms of horsepower for a tandem rotor aircraft in either
hovering flight or forward (straight and level) flight. The
various calculated power requirements are displayed as
follows:

Display:	Explanation:
PI(TL)=	induced power with tip losses
PI(TL+GE)=	induced power with tip losses plus ground effect
PO=	profile power for a single rotor system
PO(TDM)=	profile power for the tandem rotor system
PT(TDM)=	total power for the tandem rotor system

2. EQUATIONS

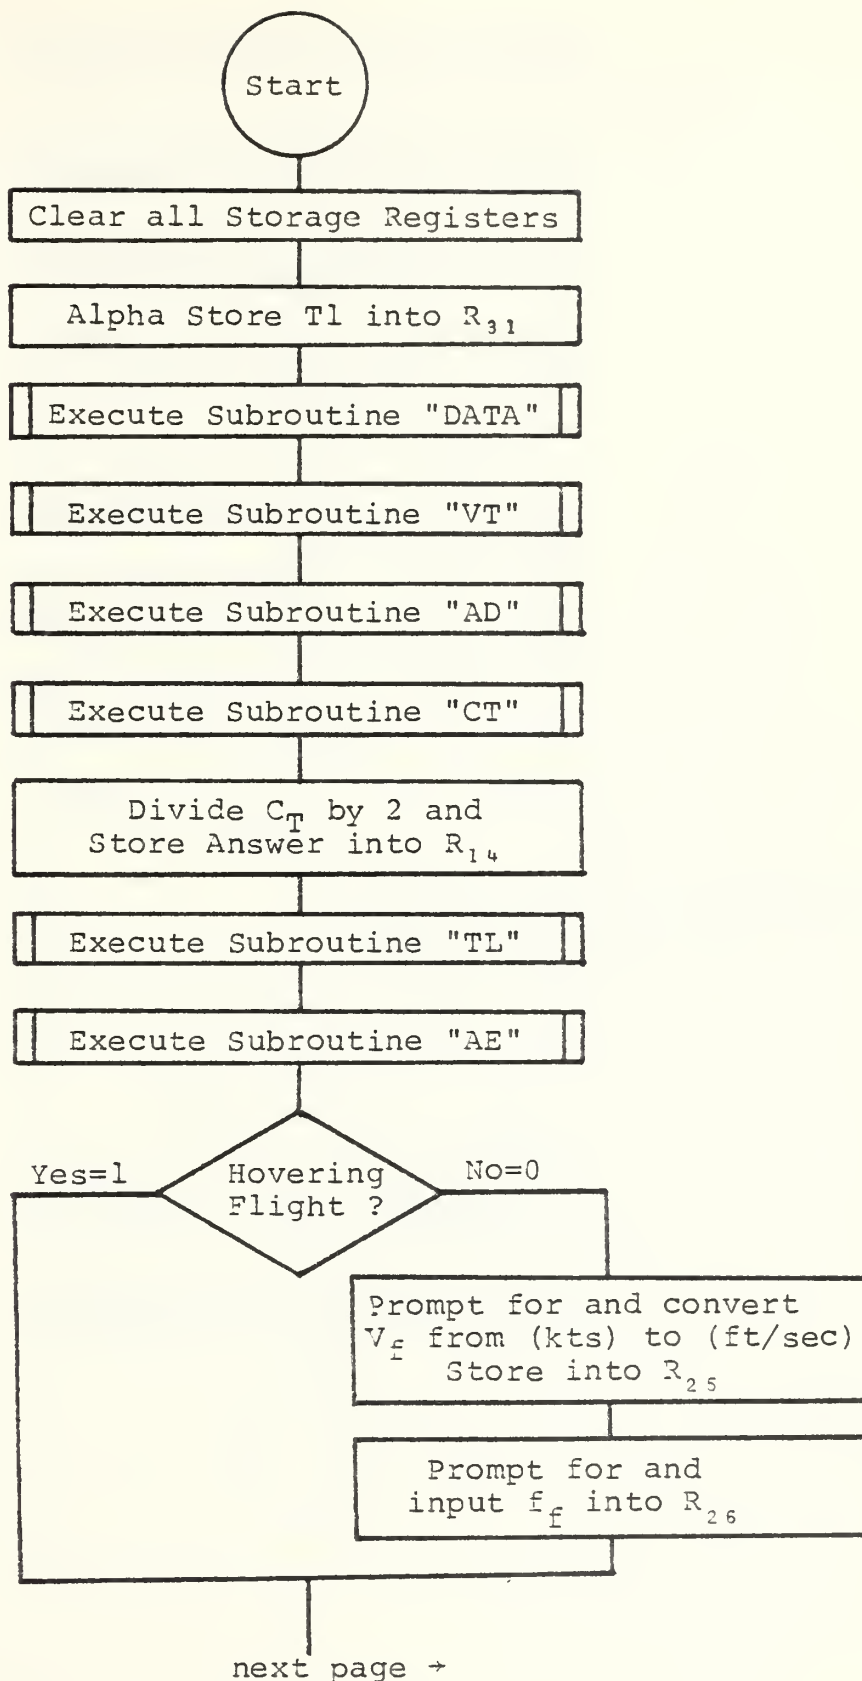

$$P_T = P_i + P_o + P_p \quad (20)$$

where:

P_T is the total power required
 P_i is the induced power required
 P_o is the profile power required
 P_p is the parasite power required

No other equations are found in the program. Consult
the subroutine listings for the various equations used.

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

Find the hover power requirements for a CH-47D, Chinook,
under the following conditions:

$C = 2.667 \text{ ft}$	$\Omega = 225 \text{ RPM} \rightarrow 23.56 \text{ rads/sec}$
$R = 30.0 \text{ ft}$	$\bar{C}_{d_o} = .008$
$b = 3$	$h = 35 \text{ ft}$
$W = 45,000 \text{ lbs}$	$D.A. = 1,500 \text{ ft}$
$d = 38.917 \text{ ft}$	

Keystrokes:

Display:

[XEQ] [ALPHA] TANDEM [ALPHA]

[R/S]	PT(TDM) =
[R/S]	4,658.47
[R/S]	CHANGE?

(Change Data? 1 is Yes, 0 is No)

1 [R/S]	C RV b R W
---------	------------

It is desired at this point to increase the number of rotor blades per rotor system from 3 to 4. To observe what effect this change will have on the hover power requirements, press the key on the calculator keyboard directly beneath the variable in need of change. In this case the $[\sqrt{x}]$ key is directly beneath the b in the display:

$[\sqrt{x}]$	b=?
--------------	-----

4 [R/S]	CHANGE?
---------	---------

(Any Further Changes? 1 is Yes, 0 is No)

0 [R/S]	d=?
---------	-----

The calculator has returned to the top of the main program and now presents the opportunity to change the distance between the rotor shafts, d. In this example, d remains the same:

38.917 [R/S]	HOVER?
--------------	--------

1 [R/S]	PI (TL) =
[R/S]	4,227.80

[R/S]	PO =
[R/S]	467.28
[R/S]	PO (TDM) =
[R/S]	934.57
[R/S]	PT (TDM) =
[R/S]	4,859.00
[R/S]	CHANGE?
0 [R/S]	0.00

Find the forward flight (straight and level) power requirements for a CH-46E, Sea Knight, under the following flight conditions:

C = 1.5625 ft	$\Omega = 264 \text{ RPM} \rightarrow 27.64 \text{ rads/sec}$
R = 25.5 ft	$\overline{C}_{dO} = .009$
b = 3	D.A. = 2,000 ft
W = 22,000 lbs	$V_f = 100 \text{ kts}$
d = 33.33 ft	$f_f = 44.3 \text{ ft}^2$
h = 2,000 ft	

Keystrokes:

Display:

[R/S]	REC?
1 [R/S]	C=?
1.5625 [R/S]	R=?

25.5 [R/S]	b=?
3 [R/S]	CdO=?
.009 [R/S]	RV=?
27.64 [R/S]	H=?
2,000 [R/S]	W=?
22,000 [R/S]	D.A.=?
2,000 [R/S]	d=?
33.33 [R/S]	HOVER?
0 [R/S]	FOR V=?
100 [R/S]	F.P.A. (FF)=?
44.3 [R/S]	PI (TL)=
[R/S]	3,235.14
[R/S]	GE=0
[R/S]	PO=
[R/S]	238.65
[R/S]	PO (TDM)=
[R/S]	477.30
[R/S]	PP=
[R/S]	434.78
[R/S]	PT (TDM)=
[R/S]	4,147.22
[R/S]	CHANGE?
1 [R/S]	C RV b R W

It is desired at this point to decrease the forward flight velocity, V_f , from 100 to 50 knots. To observe what effect

this change will have on the forward flight power requirements flag 04 must be set to return to the main program where it then becomes possible to change V_f . The flow-chart for subroutine "CG" depicts this process. In order to initiate this procedure, pick a variable and input its original value. In this example, W is used:

[LN]	W=?
22,000 [R/S]	CHANGE?
0 [R/S]	d=?
33.33 [R/S]	HOVER?
0 [R/S]	FOR V=?

CHECKS

1. PURPOSE

This program performs a short series of checks on several important parameters. It is executed immediately following the execution of one of the main programs. This program recalls and uses data that the previously executed program has put into storage. The various parameters that are checked are displayed as follows:

Display:	Explanation:
SOLID=	the solidity of the rotor system
U=	the advance ratio
M(TIP)=	the Mach Number at the tip of the advancing rotor blade
D.L.=	the disc loading of the rotor system

2. EQUATIONS

$$a = \sqrt{\gamma \cdot g_c \cdot R \cdot T(^{\circ}R)} \quad (53)$$

$$T(^{\circ}K) = T(^{\circ}C) + 273.16 \quad (54)$$

$$T(^{\circ}R) = T(^{\circ}K) \div 0.5555 \quad (55)$$

$$M_T = \frac{V_f + V_T}{a} \quad (56)$$

$$\mu = \frac{V_f}{V_T} \quad (57)$$

$$\text{DISC LOADING} = \frac{W}{A_D} \quad (58)$$

where:

$T(^{\circ}\text{C})$ is the temperature in degrees centigrade

$T(^{\circ}\text{K})$ is the temperature in degrees kelvin

$T(^{\circ}\text{R})$ is the temperature in degrees rankine

g_c is the gravitational constant $\left[32.174 \frac{\text{lb}_m\text{-ft}}{\text{lb}_f\text{-sec}^2} \right]$

A_D is the rotor disc area (ft^2)

M_T is the Mach Number at the tip of the advancing rotor blade

V_f is the forward velocity of the helicopter (ft/sec)

V_T is the tip speed of the rotor blade (ft/sec)

R is the gas constant for air $\left[53.3 \frac{\text{ft-lb}_f}{\text{lb}_m\text{-}^{\circ}\text{R}} \right]$

W is the weight (lbs)

μ is the advance ratio

a is the sonic velocity (ft/sec)

γ is the ratio of specific heats (1.4 for air)

3. FLOWCHART

4. EXAMPLE PROBLEMS AND USER INSTRUCTIONS

Execute program "FORFLT" for the CH-53E under the following characteristics and flight conditions:

$C = 2.44 \text{ ft}$	$\Omega = 179 \text{ RPM} \rightarrow 18.743 \text{ rads/sec}$
$R = 39.5 \text{ ft}$	$V_f = 140 \text{ kts}$
$b = 7$	$f_f = 63.57 \text{ ft}^2$
$h = 1000 \text{ ft}$	$\bar{C}_{dO} = .009$
$W = 70,000 \text{ lbs}$	$D.A. = 1000 \text{ ft}$

Keystrokes:

[XEQ] [ALPHA] FORFLT [ALPHA]
140 [R/S]
63.57 [R/S]
1 [R/S]
2.44 [R/S]
39.5 [R/S]
7 [R/S]
.009 [R/S]
18.743 [R/S]
1000 [R/S]
70,000 [R/S]
1000 [R/S]
[R/S]
[R/S]
[R/S]
[R/S]

Display:

FOR V=?
F.P.A.(FF)=?
REC?
C=?
R=?
b=?
CdO=?
RV=?
H=?
W=?
D.A.=?
PI=
1662.62
PI(TL)=
1699.10
GE=0

[R/S]	PO=
[R/S]	1852.87
[R/S]	PP=
[R/S]	1763.38
[R/S]	PT(MR) =
[R/S]	5315.35
[R/S]	CHANGE?
0 [R/S]	0.00

Now, execute program "CHECKS" in order to make a quick check on σ , μ , M_T , and Disc Loading. The temperature is 13° C

Keystrokes:	Display:
[XEQ] [ALPHA] CHECKS [ALPHA]	SOLID=0.1376
[R/S]	U=0.3194
[R/S]	T=?
13 [R/S]	M(TIP)=0.8783
[R/S]	D.L.=14.2808

It is important to note here that the blade loading is above 10 lbs/ft². This generates high induced velocities, which in turn can make operations in unimproved sites hazardous due to flying debris. Also, it becomes increasingly difficult to obtain safe autorotational characteristics at these higher disc loadings. [Ref. 7]

The tip Mach Number is above 0.85. This means that the advancing rotor blade is entering the transonic flow region and shock wave formation will lead to wave drag.

Blade stall effects on the retreating rotor blade have started prior to this. Therefore the actual horsepower required in forward flight will be somewhat higher due to the effects of compressibility and blade stall. [Ref. 3]
